The gross profit margin is about 10%-15%, and the single-line production capacity is 2,000 tons. Basalt fiber is a new type of inorganic, environmentally friendly, green, high-performance fiber material. It is made by rapidly drawing basalt stone, composed of oxides such as silica and alumina, through a high-temperature melt through a sieve. Continuous basalt fiber not only has high strength but also exhibits numerous excellent properties, including electrical insulation, corrosion resistance, and high-temperature resistance. The basalt fiber production process generates minimal waste and poses minimal environmental pollution. Once discarded, the product degrades directly in the environment without causing any harm, making it a green, environmentally friendly material. Basalt fiber precursor is a continuous fiber precursor made by melting basalt stone at high temperatures and then drawing it through a wire drawing process. It represents the primary form of basalt fiber production and possesses excellent properties, including high strength, high-temperature resistance, and chemical resistance.

United States market for Basalt Fiber Precursor is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.
