The global Basalt Fiber Reinforced Polymer (BFRP) Springs market size is predicted to grow from US\$ 40.3 million in 2025 to US\$ 109 million in 2032; it is expected to grow at a CAGR of 15.6% from 2026 to 2032.

In 2024, the global production of basalt fiber composite springs was estimated at 50,000 to 200,000 units, with an average selling price of approximately US\$30 to US\$700 per unit and a gross profit margin of about 35%. Single-line production capacity was approximately 1,500 to 5,500 units per year. Basalt fiber composite springs are lightweight, high-performance elastic elements made by embedding basalt fiber as the main reinforcing material into a polymer matrix (usually epoxy resin) through composite material processes (such as pultrusion, winding, or molding). They inherit the high stiffness, excellent temperature resistance, and good corrosion resistance of basalt fiber, making them potentially applicable in fields requiring higher stiffness and wider operating temperature ranges. The upstream of the basalt fiber spring industry involves basalt ore mining and melting and drawing into continuous basalt fiber and synthetic resin raw materials. The midstream involves spring design and manufacturing, combining fibers and resin into spring products through composite material processes such as winding, pultrusion, or molding. Downstream applications include high-end automobiles, special equipment, aerospace, and industrial machinery. The demand stems from the downstream industry's pursuit of comprehensive performance characteristics, including extreme lightweight, high specific stiffness, corrosion resistance, and long fatigue life.
