A baseband communication chip is an integrated circuit chip used to process and control baseband signal processing and modulation and demodulation functions in wireless communication equipment. The baseband signal refers to the original signal, usually a digital signal, that transmits data in the communication system. The baseband communication chip plays a key role in wireless communication equipment. It is responsible for converting digital data into analog signals for wireless transmission, and converting received analog signals into digital data for processing. It usually integrates a variety of functions, including modulation and demodulation, codec, signal processing, data transmission control, etc. The main functions of the baseband communication chip

include: 1. Modulation and demodulation: convert digital data into analog signals for transmission, and convert received analog signals into digital data for processing. 2. Encoding and decoding: Encoding and decoding digital data to enhance data reliability and security. 3. Signal processing: Filtering, gain control, spectrum analysis and other processing are performed on the received signal to improve signal quality and anti-interference ability. 4. Data transmission control: control data transmission rate, channel selection, power consumption management, etc., to meet the needs of different application scenarios. Baseband communication chips are widely used in various wireless communication devices, including mobile phones, wireless network devices, wireless sensor networks, and Internet of Things devices.
