## Abstracts

The global Basement Membrane Extract Gel market size is predicted to grow from US\$ 108 million in 2025 to US\$ 233 million in 2032; it is expected to grow at a CAGR of 11.6% from 2026 to 2032.

Basement Membrane Extract Gel (BME Gel) is a biomaterial consisting of a mixture of native basement membrane complex proteins purified from mouse EHS sarcoma, which remains liquid at low temperatures and self-assembles into a three-dimensional porous hydrogel at 37 °C to mimic the in vivo extracellular matrix microenvironment of basement membranes for in vitro biological experiments. Basement Membrane Extract Gel varies widely in unit prices ranging from 25 to 80 US dollars per milliliter, with premium low-growth-factor and phenol-red-free variants priced at the higher end of the bracket. Its global industrial chain covers three interconnected segments. Upstream inputs include standardized SPF mouse colonies, specialized low-temperature purification reagents and precision bioprocessing hardware, where controlled biological raw material supply forms a core cost driver. Midstream procedures focus on protein extraction, sterile filling and continuous sub-zero cold-chain distribution, with technical barriers centered on preserving native protein bioactivity and consistent batch-to-batch performance. Downstream demand is distributed across global academic labs, biopharmaceutical R&D centers, CRO platforms and organoid developers for cell invasion assays, three-dimensional cell culture and angiogenesis research. Established biotech manufacturers with mature purification workflows and cross-continental logistics networks dominate mainstream global research and preclinical consumption.

## Market Driving Factors

Global investment in biomedicine and regenerative medicine keeps rising.

Pharmaceutical companies, CROs and universities focus heavily on oncology, organ-on-a-chip and stem cell research. Conventional 2D cell culture cannot generate reliable data matching human physiological conditions, while basement membrane extract gel mimics in vivo extracellular matrix microenvironment, supporting core experiments such as 3D organoid culture, cell invasion assay and drug sensitivity screening. The number of global organoid research projects and preclinical pipelines expands year by year, and regular bulk procurement from research institutes creates steady rigid demand, directly fueling continuous growth of the matrix gel market.

The global trend of standardized biological experiments boosts market demand. Regulatory authorities worldwide encourage adopting 3D in vitro models to reduce animal trials, easing ethical disputes while improving the authenticity of pharmacodynamic and toxicological test data. This gel contains natural basement membrane components including laminin and collagen IV, with gel-forming properties suitable for diverse in vitro disease modeling. As personalized medicine and commercialized in vitro disease models advance, purchasing volume from biotech firms and testing institutions keeps expanding, unlocking long-term growth potential for the industry.

Iterative product segmentation and perfected global logistics unlock new market increments. Manufacturers launch diversified specifications including low-growth-factor, phenol-red-free and GMP industrial-grade gels, covering scenarios from basic research to industrialized cell therapy. Mature global cold-chain logistics solve the strict sub-zero storage and transportation requirements, lowering cross-border procurement barriers. New biological laboratories and research platforms are constructed worldwide, and surging R&D pipelines in stem cell and tissue engineering fields lift both purchasing frequency and volume of end users.

### Market Challenges

The upstream raw material supply faces obvious bottlenecks. The core raw material of this gel is extracted from SPF-grade EHS tumor-bearing mice. Fixed cycles are required for mouse breeding, tumor induction and protein extraction, making it impossible to expand production capacity flexibly in a short time. High costs for lab animal raising and special low-temperature purification reagents, together with mandatory full-process cold-chain delivery, jointly push up end-product prices, greatly raising the consumable budget of research labs and pharmaceutical firms and restricting large-scale usage among small and medium-sized R&D institutions.

Animal-derived products have inherent standardization defects. Protein and growth factor contents extracted from mouse tissues vary between batches, leading to poor repeatability of experimental data and interfering with high-precision trials for drug registration. Meanwhile, global ethical supervision on animal experiments is tightening, and multiple countries impose strict approval and usage restrictions on animal-derived biological reagents. Enterprises face higher compliance audit costs, and the market access threshold for new products keeps rising.

Leading enterprises dominate the market relying on purification process patents and mature global distribution channels, creating high technical barriers for new entrants to maintain protein bioactivity and batch consistency. Animal-free alternative materials such as synthetic biomimetic hydrogels and recombinant protein matrices are continuously developed and commercialized. With advantages of lower costs and uniform batch performance, these substitutes divert demand from mid-to-low-end research markets and pose long-term competitive pressure on traditional basement membrane extract gel products.
