The global Battery Grade Thionyl Chloride market size is predicted to grow from US\$ 7.5 million in 2025 to US\$ 17.24 million in 2032; it is expected to grow at a CAGR of 12.9% from 2026 to 2032.

Thionyl Chloride is an important raw material in the chlorination process of LiFSI, which is very similar to the production of aramid monomers. According to the environmental impact assessment report and patent of Tianci Materials, the preparation process of LiFSI is mainly divided into four steps: chlorination, fluorination, salinization, and purification. Sulfoxide chloride is an important raw material in the preparation of LiFSI chlorination process. With the release of LiFSI production capacity, it is expected to bring a significant increase in demand for sulfoxide chloride in the future. Technically speaking, the first step of LiFSI is extremely similar to the production of aramid monomers. The production of meta/para phthaloyl chloride involves the chlorination of carboxylic acid, while the production of amino sulfonic acid involves the chlorination of sulfonic acid on both sides. In addition, through early product promotion and application, the purity and quality of the produced sulfoxide chloride have been verified, which also provides possibilities for the downstream expansion of LiFSI.
