## Abstracts

The global Battery Grade Vinyl Carbonate market size is predicted to grow from US\$ 274 million in 2025 to US\$ 440 million in 2032; it is expected to grow at a CAGR of 7.1% from 2026 to 2032.

Battery grade ethylene carbonate is a key organic solvent material used in lithium-ion battery electrolyte systems. It typically has high purity, low moisture content, low metal ion content, and good electrochemical stability. In the electrolyte, it mainly plays a role in improving the dielectric constant, promoting lithium salt dissolution, and forming a stable SEI film, thereby enhancing the cycling performance, safety, and low-temperature performance of the battery. It is widely used in power batteries, energy storage batteries, and consumer electronics batteries, and is one of the core basic materials in lithium-ion battery electrolyte formulations. In 2025, global Battery Grade Vinyl Carbonate production reached approximately 185.16 K MT, with an average global market price of around US\$ 1,511 per MT.

With the rapid development of the new energy vehicle industry and the significant increase in demand for energy storage batteries, the market demand for battery grade ethylene carbonate continues to expand, especially in high energy density batteries and high safety battery systems, where the demand for high-purity and low impurity products continues to increase. At the same time, the upgrading of electrolyte formulations and the development of solid-state battery technology also promote the evolution of products towards higher purity and customization. In the future, the industry as a whole will show a trend of stable demand growth, increased technological barriers, and gradually large-scale and integrated production capacity.
