The research report highlights the growth potential of the global Battery Recycling market. Battery Recycling are expected to show stable growth in the future market. However, product differentiation, reducing costs, and supply chain optimization remain crucial for the widespread adoption of Battery Recycling. Market players need to invest in research and development, forge strategic partnerships, and align their offerings with evolving consumer preferences to capitalize on the immense opportunities presented by the Battery Recycling market.

Battery recycling is a process that aims at diminishing the number of batteries being disposed of as municipal solid waste. Batteries consist of several heavy metals and toxic chemicals. Therefore, disposing of them as regular trash has raised concerns about water pollution and soil contamination. The soil and water pollution caused by the disposal of batteries as a municipal waste has resulted in the need to take necessary steps to recycle batteries. Various governments have mandated battery recycling processes.

The lead-acid battery chemistry segment dominated the global battery recycling market in 2017, followed by the lithium-based and nickel-based chemistries. Lead-acid is the most common type of chemistry, and is used in a wide range of automotive and

industrial applications. The lead-acid chemistry segment is projected to witness the highest growth from 2018 to 2023, due to the increasing use of starting, lighting, and ignition (SLI) batteries.
