The global Beam Focusing System market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

The beam focusing system is an important technical device, a system for controlling and adjusting the spatial distribution and transmission path of charged particle beams (such as ion beams, electron beams, etc.). The system uses electromagnetic fields (such as electric fields and magnetic fields) to keep the particle beam in a focused state during transmission so as to obtain a smaller beam spot size and higher energy density at the target position.

The working principle of the beam focusing system is based on the action of electromagnetic force. By adjusting the intensity and distribution of the electric or magnetic field, the charged particles can be subjected to different forces in the electromagnetic field, thereby changing their motion trajectory and achieving the focusing and control of the ion beam. The electric field focusing system focuses the ion beam mainly through the electric field between the electrode plates, while the magnetic field focusing system uses the Lorentz force of the magnetic field on the charged particles to achieve focusing.
