A beam rotator is an optical element that can rotate the polarization direction of a beam by a certain angle. It usually consists of a pair of polarizing prisms or polarizers, which can rotate the incident linearly polarized or circularly polarized light by a certain angle, and output the rotated polarized light. Beam rotators are widely used in optical measurement, optical communication, optical imaging and other fields. For example, using a beam rotator in optical measurement can realize the measurement of multiple directions of the sample, thereby improving the accuracy and reliability of the measurement; using a beam rotator in optical communication can realize the control and adjustment of polarized light, thereby improving Quality and reliability of

communications. The design of the beam rotator needs to consider many factors, such as parameters such as the material, thickness, and refractive index of the polarizing prism or polarizer, as well as parameters such as the size and stability of the rotation angle. In addition, the manufacture of beam rotators requires high-precision processing and testing techniques to guarantee their optical performance and stability.
