Bearing Cage for Wind Power Generation refers to a critical structural component used in rolling bearing systems of wind turbine generators that positions and guides rolling elements (such as balls or rollers) to reduce friction and wear, ensuring reliability and durability under high loads and long operating cycles. These bearing cages must meet extreme environmental conditions (such as temperature variations, vibration, and shock loads) and long service life requirements, and are typically manufactured from high-strength steel, copper alloys, or engineered composite materials. They are widely used in main shaft bearings, gearbox bearings, and yaw/pitch system bearings in wind turbine generators, and are key components for improving turbine reliability and reducing maintenance downtime. In 2025, the global market size of bearing cages for wind power generation is approximately USD 432.8 million, with annual shipments of about 15.37 million units. The market is expected to grow at a compound annual growth rate (CAGR) of around 6.15% over the next five years. The average market price is approximately USD 28.15 per unit, typical single-line production capacity ranges from 650,000 to 2,450,000 units per year, and industry gross margins generally fall within the 21%–36% range.
