A bearing holder is a device used in various machines to support bearings in the correct position to receive the load and rotation of a rotating shaft. It is attached to the machine's body and holds the bearings by fitting them. The design of a bearing holder must match the load that the bearing is subjected to, and it should have sufficient rigidity based on the bearing size.

Bearing holders are predominantly used in industrial machinery. They must be rigid enough to withstand the load received by the rotating shaft. Considerations such as surface roughness of the bore and corner radii size are important. Bearing holders simplify the design and manufacturing of the housing part that holds the bearing. They are typically mounted as single or double bearing holders for deep groove ball bearings. For angular contact bearings, they can be used with a back-mounted double bearing or with an additional deep groove ball bearing.

The global Bearing Holder market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
