Bearings with solid lubricants are specialized components designed for friction reduction in mechanical systems. Unlike traditional bearings that rely on liquid or grease lubrication, these bearings incorporate solid lubricating materials, such as graphite or molybdenum disulfide, directly into their structure. This solid lubricant enhances the bearing's performance by providing continuous and self-replenishing lubrication, resulting in reduced friction, wear, and maintenance requirements. Bearings with solid lubricants find applications in environments with high temperatures, extreme pressures, or where frequent re-lubrication is impractical or challenging, offering improved reliability and extended operational lifespan to machinery and equipment.

The global Bearings with Solid Lubricants market size is projected to grow from US\$ million in 2023 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
