Beer Ceramic Membrane Filtration System is a precision filtration technology used in breweries to recover beer from residual yeast sludge in fermentation tanks. It operates through cross-flow filtration and batch circulation, continuously separating beer components as yeast concentration increases. The system is designed to enhance beer recovery while reducing waste discharge, offering a sustainable solution by minimizing beer loss and lowering wastewater treatment costs. Its modular design includes a filtration unit and a cleaning station, supporting semi-continuous operation, and allows for customization in membrane pore sizes and automation features. The system also facilitates the economic reuse of discarded yeast, contributing to resource efficiency in the brewing process. By 2024, the global production of beer ceramic membrane filtration system reached approximately 800 units, with an average selling price of approximately US$330k per unit.
