A bellows pressure switch is a device used to detect and control fluid pressure. It consists of a bellows that deforms when subjected to changes in external pressure. This deformation is connected to the switch mechanism through a mechanical connection or an electronic sensor, which triggers a change of state of the switch. When the pressure reaches or exceeds a preset value, the bellows deforms, triggering the switch mechanism and switching the switch from one state to the other. This state change can

be used to control the operation of other devices, such as starting or stopping a system, alerting or alarming. Bellows pressure switches are commonly used in industrial and automation systems to monitor the pressure of liquids or gases, and as a safety device to protect equipment and systems from excessive or low pressure.
