Belt Roaster is a high-temperature calcining equipment for continuous production. It is used for drying and roasting mobile catalysts or fixed catalysts such as denitration catalysts, automobile carriers, petroleum cracking catalysis, etc. The equipment is composed of independent units. Each unit section includes a circulation fan, heating device, individual or common fresh air intake system and tail gas exhaust system, etc. Therefore, the operating parameters such as the quantity of drying medium, temperature, humidity and exhaust gas circulation volume can be controlled independently. According to the heating characteristics of different materials, the equipment sets multiple units according to different heating, constant temperature, cooling and cooling times. Each unit Independent temperature control, each unit's independent circulating fan is independently controlled, forming an independent and relatively sealed hot air circulation channel in each unit. The circulating hot air penetrates the carrier from the mesh belt to complete the relevant physical and chemical reactions of the product roasting process. The product passes through the discharge end come out.
