Benign prostatic hyperplasia (BPH) is a condition occurring in men when the prostate gland is enlarged. Benign prostatic hyperplasia is also termed as benign prostatic hypertrophy or benign prostatic obstruction. Prostate gland grows in primarily two phases, firstly during puberty when the size of the prostate doubles and the second growth phase starts at 25 years and continues throughout the lifetime. While the prostate gland enlarges in a man, it presses and pinches the urethra making the bladder wall thick. This pressure and squeeze on the urethra weaken the bladder and makes it lose the ability to empty the urine completely. Urinary retention and narrowing of the urethra can cause many problems which are associated with benign prostatic hyperplasia. Benign prostatic hyperplasia is one of the common prostate problems for

men older than age 50.

Benign prostatic hyperplasia testing market is primarily driven by a few key factors such as the growing geriatric male population, patient awareness regarding rising healthcare concerns, increase in healthcare expenditure, increasing government initiatives and availability of minimally invasive surgery as a drug replacement, faster and easy performing diagnosis test results. The market is likely to grow owing to the novel diagnostic methods which are accurate than the conventional PSA blood test for benign prostatic hyperplasia which is effective in diagnosis and is expected to fuel the growth of benign prostatic hyperplasia testing market.
