Abstracts

The global Berth Planning System market size is predicted to grow from US$ 73.47 million in 2025 to US$ 156 million in 2032; it is expected to grow at a CAGR of 11.6% from 2026 to 2032.

In 2024, the average deployment cost of a single berth planning system was approximately USD 110,000–160,000 per port (approximately USD 3,000–12,000 per month if using a SaaS subscription). Berth planning system is primarily used in port dispatch centers to achieve functions such as visualization of vessel arrival schedules (ETAs/ETDs), berth resource allocation, tidal and meteorological linkage, tugboat pilotage scheduling, terminal operation load forecasting, and port congestion early warning. Key performance indicators include the number of supported berths, vessel schedule forecast accuracy (typically >85%), AIS/port TOS system interface compatibility, automatic rule-based scheduling capabilities, and mobile terminal access capabilities. The system's value lies in reducing average berthing delays caused by berthing conflicts, operational waiting, and missed tide windows (reducing delays by 8–18 hours per vessel), thereby significantly improving terminal throughput efficiency and shipping network on-time performance. The upstream mainly consists of AIS/weather/tidal data services, TOS/ERP system interface development, and cloud server computing power costs; downstream customers include public port operators, container terminal groups, oil and gas terminals, and bulk cargo ports. As a BMS vendor focusing on visualization and prediction algorithms, Portchain had approximately 65–75 port/terminal customers with operational deployments in 2024, primarily through subscription-based SaaS.

United States market for Berth Planning System is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.
