Abstracts

According to this study, the global BGMS (Blood Glucose Monitoring System) market size will reach US\$ 31930 million by 2031.

A blood glucose monitoring system is a medical device or system used to measure and track blood glucose (sugar) levels in individuals, especially those with diabetes. It includes traditional self-monitoring blood glucose (SMBG) devices using test strips and glucometers, as well as advanced continuous glucose monitoring (CGM) systems that provide real-time data through wearable sensors. These systems help patients and healthcare providers manage blood sugar levels, adjust medications, and prevent complications like hypoglycemia or hyperglycemia.

The blood glucose monitoring system market is primarily driven by the global rise in diabetes prevalence, fueled by aging populations, sedentary lifestyles, and poor dietary habits. Growing awareness of the importance of glucose control, along with increased healthcare spending and government support for chronic disease management, is boosting demand for both continuous glucose monitors (CGMs) and self-monitoring blood glucose (SMBG) devices. Technological advancements such as smartphone connectivity, real-time alerts, and non-invasive sensors are further expanding the market, especially among younger and tech-savvy patients.

Despite strong demand, the market faces several challenges. High device costs, especially for CGMs and advanced digital platforms, limit access in low- and middle-income countries. In addition, user adherence and accuracy concerns—particularly with improper device usage or calibration errors—can impact clinical outcomes and patient trust. Regulatory hurdles, reimbursement issues, and the need for continuous innovation to differentiate in a competitive market also pose significant obstacles for

manufacturers.
