The global Bi-Metallic Thermometers market size is predicted to grow from US\$ 2695 million in 2025 to US\$ 4273 million in 2031; it is expected to grow at a CAGR of 8.0% from 2025 to 2031.

Bi-metallic thermometers are temperature measurement devices that use the principle of thermal expansion of two different metals to indicate and measure temperature changes. These thermometers consist of a bimetallic strip, which is a composite strip made of two metal layers with different coefficients of thermal expansion. The strip's design allows it to bend or twist in response to temperature variations.

The market has seen a shift towards digital temperature measurement solutions, such as digital thermometers and sensors, which offer real-time data logging, remote monitoring, and integration with automation systems. This trend has affected the demand for traditional bi-metallic thermometers.
