The global Bicycle Metal Parts Lubricant market size is predicted to grow from US\$ 137 million in 2025 to US\$ 237 million in 2032; it is expected to grow at a CAGR of 8.3% from 2026 to 2032.

Bicycle metal component lubricant is a functional lubricant and protective oil specifically designed for various metal moving and connecting parts of bicycles. It is mainly used in areas such as chains, freewheels, bearings, threaded interfaces, axles, and steel cables. Its core function is to form a stable oil film on metal contact surfaces to reduce friction and wear, prevent corrosion, and suppress abnormal noise. This type of lubricant typically emphasizes penetration, water resistance, and oxidation resistance, maintaining lubrication performance in humid, muddy, or high-frequency use environments. It is an indispensable basic consumable for long-term use and meticulous maintenance of bicycles. Sales volume in 2025 was 5.25 million bottles, with an average price of \$25, total production capacity of 6 million bottles, and a gross profit margin of 38%.

The demand for lubricants for bicycle metal parts is gradually diversifying beyond general industrial or household rust-preventive oils. As mid-to-high-end bicycles place increasing emphasis on transmission efficiency, noise control, and component lifespan, users are showing significantly higher acceptance of lubricants with 'specialized formulas, no damage to seals, and long-term stability.' This is driving manufacturers to segment their designs around different metal-contact scenarios such as chains, bearings, and threads, upgrading products from low-tech consumables to consumer industrial products with certain formula barriers and brand premiums.

The market growth of this type of lubricant is primarily determined by the existing bicycle

stock and usage intensity, rather than fluctuations in new bicycle sales. The increasing popularity of commuter cycling, e-bikes, and outdoor cycling has led to a rise in the demand for maintenance of metal components in humid and high-load environments, boosting repurchase frequency. In the long run, the market will exhibit a structure of 'stable volume and tiered pricing': low-end products will focus on volume sales, while high-end products will rely on performance and brand to generate profits. Industry concentration is expected to gradually increase among specialized brands.
