The global Bicycle Vacuum Tire market size is predicted to grow from US$ 721 million in 2025 to US$ 841 million in 2031; it is expected to grow at a CAGR of 2.6% from 2025 to 2031.

Bicycle vacuum tire is a tire structure that does not require an inner tube and uses a 'vacuum' design to maintain air pressure. It is different from traditional inner tube tires. The vacuum tire forms an airtight closed space between the tire body and the wheel rim, and contacts the wheel rim through a sealing strip or a special sealing liquid to ensure that the air pressure is maintained. Vacuum tires usually use a stronger sidewall structure, which can prevent the inner tube from bursting while also providing better puncture resistance and higher comfort because it can be used at a lower tire pressure, thereby improving the shock absorption effect of the tire. Compared with traditional inner tube tires, vacuum tires reduce the risk of air leakage or blowouts caused by damaged inner tubes, while reducing the weight and friction resistance of the wheels, making the riding experience smoother.
