Bidirectional antenna booster is an electronic device used to enhance the ability of an antenna system to receive and transmit signals. It is usually designed for use in wireless communication systems such as radio, mobile communications and wireless networks. Its main function is to amplify the received and transmitted signals from the antenna to improve the strength and reliability of the signal. Compared with unidirectional amplifiers, bidirectional antenna gainers can simultaneously enhance the ability of the antenna to receive and transmit signals, so it is called bidirectional. This makes it very useful in two-way communication systems, such as duplex communication systems, where signals can be transmitted in both directions on the same frequency at the same time.

The global Bidirectional Antenna Booster market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
