The global Bidirectional Barbed Suture market size is predicted to grow from US\$ 223 million in 2025 to US\$ 453 million in 2032; it is expected to grow at a CAGR of 10.9% from 2026 to 2032.

A barbed suture is a type of knotless surgical suture that has barbs on its surface. While suturing tissue, these barbs penetrate inside the tissue and lock them into place, eliminating the need for knots to tie the suture. Conventional sutures rely on a surgeon's ability to tie secure knots; barbed sutures provide a knotless alternative in some surgical situations. Barbed sutures are primarily used in cosmetic surgery. Bi-directional is a double-armed suture. Barbs reverse direction at the mid-point of the suture.

The market for bidirectional barbed sutures has been growing due to the increasing demand for advanced suturing materials and techniques in surgical procedures. The key factors driving this market's growth include the rising prevalence of chronic diseases, the growing geriatric population, and advancements in surgical technology.
