Abstracts

The global Bidirectional Geogrid market size is predicted to grow from US$ 1023 million in 2025 to US$ 1457 million in 2032; it is expected to grow at a CAGR of 5.3% from 2026 to 2032.

In 2024, global Bidirectional Geogrid production reached approximately 320.87 million square meter, with an average global market price of around US$ 3.1 per square meter. A bidirectional geogrid is a type of geosynthetic material that possesses approximately equal tensile strength and tensile modulus in both the machine direction (longitudinal) and the cross-machine direction (transverse). It is typically manufactured by precision punching a polymeric sheet (e.g., polypropylene PP or high-density polyethylene HDPE) followed by simultaneous or sequential oriented stretching in two perpendicular directions. This process induces a high degree of molecular orientation along both axes, resulting in an integral grid structure with uniform rectangular or square apertures. Its primary function is to provide lateral confinement to soil in geotechnical applications. Through the interlocking mechanism between its apertures and the soil/aggregate particles, it significantly enhances the integrity, load-bearing capacity, and stability of the soil mass, while effectively distributing loads and reducing differential settlement. It is predominantly used in applications requiring uniform biaxial reinforcement, such as soft soil stabilization, embankments, road bases, and slope protection.

United States market for Bidirectional Geogrid is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.

China market for Bidirectional Geogrid is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.

Europe market for Bidirectional Geogrid is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.
