Big data processing and distribution systems provide a way to collect, distribute, store and manage large amounts of unstructured data sets in real time. These solutions provide a simple way to process and distribute data across parallel computing clusters in an organized manner. These products are built for scale and can run on hundreds or thousands of machines simultaneously, each providing local compute and storage capabilities. Big data processing and distribution systems provide a degree of simplification to the common business problem of large-scale data collection and are most commonly used by companies that need to organize large amounts of data. Many of these products offer distributions that run on the open source big data cluster tool Hadoop. Companies often have dedicated administrators to manage big data clusters. This role requires in-depth knowledge of database administration, data extraction, and writing host system scripting languages. Administrator responsibilities typically include data storage implementation, performance maintenance, maintenance, security, and ingestion of data sets. Businesses often use big data analytics tools to prepare, manipulate, and model the data collected by these systems.

The global Big Data Processing And Distribution Systems market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
