A bike rearview radar is a safety device designed to enhance the awareness of cyclists by providing real-time alerts about vehicles approaching from behind. Using radar technology, the device detects the presence and speed of vehicles approaching from the rear and alerts the cyclist through visual or audible signals. The radar sensor, typically mounted on the rear of the bike, continuously scans the surrounding environment and communicates with a display unit or compatible cycling computer mounted on the handlebars. When a vehicle is detected within the radar's range, the cyclist is alerted, allowing them to take appropriate action to avoid potential collisions. Bike rearview radars are particularly useful in situations where visibility is limited, such as during low-light conditions or when riding in heavy traffic, helping cyclists stay safer on the road.
