Biliary and pancreatic stents are medical devices used to treat blockages in the bile ducts or pancreatic ducts. These devices are usually made of metal or plastic and are inserted into the ducts to help keep them open and allow bile or pancreatic juice to flow freely. Biliary stents are used to treat blockages in the bile ducts, which can be caused by a variety of conditions such as gallstones, tumors, or inflammation. They can be placed either temporarily or permanently depending on the cause of the blockage.

The global biliary and pancreatic stent market is driven by the increasing prevalence of gastrointestinal cancers, rising adoption of minimally invasive procedures, and advancements in stent materials such as self-expandable metal and biodegradable stents. Continuous innovation from major manufacturers and growing demand in emerging markets are contributing to market expansion, while regulatory approval processes and pricing pressures remain key challenges.
