The global Bilirubin Measuring Device market size is predicted to grow from US\$ 697 million in 2025 to US\$ 1206 million in 2032; it is expected to grow at a CAGR of 8.3% from 2026 to 2032.

Neonatal jaundice is a yellowish discoloration of the skin, conjunctiva, and sclera due to elevated serum or plasma bilirubin during the neonatal period. A bilirubin measuring device is a device used to measure bilirubin levels and is often used in neonatal intensive units to screen new-borns for jaundice.

Neonatal jaundice is a frequent source of concern for parents and caregivers. It can cause serious problems, including bilirubin encephalopathy if ignored. The condition is very common among neonates globally. As per the August 2022 update of the NCBI data, nearly 60% of term and 80% of preterm newborns develop clinical jaundice in the first week after birth. Additionally, as per the source above, most newborns with clinical jaundice have unconjugated hyperbilirubinemia (UHB), but conjugated hyperbilirubinemia (CHB), which is invariably abnormal and indicates an underlying medical reason, is present in some newborns with jaundice. Thus, this high risk of jaundice among neonates is creating demand for bilirubin tests. Thus, the demand for transcutaneous bilirubinometers is increasing, driving the market's growth.
