The global Binocular Face Recognition Module market size is predicted to grow from US$ million in 2025 to US$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

Binocular face recognition module uses dual-camera technology to capture and recognize three-dimensional information of the face by simulating the human eye visual system. The module uses two cameras to capture facial images from different angles, and obtains the depth information of the face by calculating the parallax between the two images, thereby constructing a more accurate three-dimensional face model. This technology not only improves the accuracy and robustness of face recognition, but also effectively resists two-dimensional attacks such as photos and videos. The binocular face recognition module is widely used in access control systems, security monitoring, smart payment and other fields, providing users with safer and more convenient identity authentication services.
