Currently, there are four methods for the development of soybean-based adhesives. The first one is the addition of soybean flour to the synthetic adhesives that reduces consumption of the synthetic adhesives. The second method is the use of soy flour as an extender in the PF resins for plywood manufacturing. The third method is the denaturation of soy proteins. The soybean protein is first denatured under various conditions and chemicals and is later used as adhesives. The fourth method is by the usage of cross-linking agent for curing soybean protein and is later used as an adhesive.

The global Bio-based Sealant market size is projected to grow from US\$ million in 2023 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
