Implant graft is a surgical procedure used to fix problems with bones or joints. Bone grafting, or transplanting of bone tissue, is beneficial in fixing bones that are damaged from trauma, or problem joints. It's also useful for growing bone around an implanted device, such as a total knee replacement. A bone graft may fill a void where bone is absent or help provide structural stability. The bone used in a bone graft can come from your body, a donor, or it can be entirely man-made. The bone graft can provide a framework where new, living bone can grow if it's accepted by the body. Bone Allograft uses bone from a deceased donor or a cadaver that has been cleaned and stored in a tissue bank. Bone Xenograft use bone from other species, such as porcine, bovine and others.
