The process of applying natural or controlled antimicrobials to preserve food materials for extending its shelf life is known as biopreservation. The biopreservation process is usually carried out with the help of lactic acid bacteria (LAB) as they are inhibitory to microbes responsible for food spoilage. The key agents applied in biopreservation process are lactic acid bacteria, yeast, and bacteriophages. The process is carried out to preserve materials such as meat, seafood, and other food materials.

In terms of value, the U.S. led the market in 2017, however, in terms of future growth, India and China are expected to grow at a rapid pace in the near future due to the increasing research activities and biobanking projects. With respect to European market, the bio-preservative market has also shown its mark owing to the improving

regulatory guidelines, developing infrastructure, and biobanking projects, which are more prevalent in the Eastern Europe.
