The global Bioabsorbable Implants in Orthopaedics market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

Bioabsorbable implants in orthopaedics are medical devices used to support the healing of bones, ligaments, and tissues after fractures, injuries, or surgeries. These implants are made from materials such as polylactic acid (PLA), polyglycolic acid (PGA), or other biocompatible polymers that gradually dissolve and are absorbed by the body over time, eliminating the need for a second surgery to remove the implant. Bioabsorbable implants provide temporary support to the injured area while the body heals, allowing for natural tissue regeneration and reducing the risk of long-term complications associated with metal implants, such as infection or irritation. They are commonly used in procedures like fracture fixation, tendon repairs, and ligament reconstructions.
