Bioartificial liver treatment technology is a kind of extracorporeal blood purification equipment used to replace or support liver function, mainly composed of bioreactor,

artificial liver machine, blood pipeline, heater, oxygenator, heparin pump, plasma separator, data Recording and other devices. The treatment method is to export the plasma of patients with liver failure through an artificial liver pipeline, and separate it into blood cells and plasma through a plasma separator; the plasma with toxin enters the improved bioreactor loaded with HL2 cells after oxygenation, and the toxin Through diffusion, the overflow contacts with the hepatocytes in the reactor and is purified; the purified plasma and blood cells are reunited and then reinfused into the patient to complete the treatment cycle.
