The global Biochar Packing Media market size is predicted to grow from US\$ 46.53 million in 2025 to US\$ 153 million in 2032; it is expected to grow at a CAGR of 18.7% from 2026 to 2032.

In 2025, global sales volume of Biochar Packing Media was approximately 58,000 tons, with an average global market price of about USD 820/ton. The gross margin of major producers was generally in the range of 25%-40%.

Biochar Packing Media are porous carbon-based environmental packing materials produced from biomass feedstocks such as straw, rice husks, wood, bamboo, and fruit shells through carbonization, activation, modification, or forming processes. These products feature well-developed pore structures, relatively large specific surface area, strong adsorption capacity, good microbial attachment properties, and renewable feedstock sources. In engineering systems, they can simultaneously function as packing support media, filtration and adsorption media, biofilm carriers, and nitrogen and phosphorus removal media.

The upstream segment of Biochar Packing Media mainly includes biomass feedstocks such as agricultural residues, wood, bamboo, and fruit shells, as well as carbonization equipment, activating agents, modification additives, and forming auxiliaries. The midstream segment involves pyrolysis carbonization, screening and granulation, functional modification, forming, and quality control to produce packing media with different pore sizes, bulk densities, and functional types. Downstream applications are mainly concentrated in water treatment, waste gas treatment, and soil remediation. The value of the industry is mainly concentrated in feedstock stability, pore-structure regulation, functional modification, service life, and engineering adaptability.

United States market for Biochar Packing Media is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
