Biochemistry analyzer is used in laboratories to measure chemicals in biological samples. It focuses on analytes such as drugs of abuse, specific proteins, electrolytes, and enzyme, and metabolite tests for liver, cardiac, and renal function. Biochemical analyzer is made of an optical engine that comprises detectors, light sources, and other optical elements, sample movement, automation control and processing, environmental monitoring, power management, and control for humidity, pressure, and temperature. Highly automated biochemical analyzers, which include automated sample loading, mechanical control, data processing and tube cleaning have greater efficiency. Fully automatic analyzer, which is a high performance biochemistry analyzer, is used to measure various blood biochemical parameters such as urea, glucose, and bilirubin that are associated with various disorders such as kidney diseases, diabetes, liver failures, and other metabolic imbalances. Some analyzers are also used to detect DNA molecules in the samples.

The global Biochemistry Analyzers market size is projected to grow from US\$ 2781.3 million in 2022 to US\$ 3471.2 million in 2029; it is expected to grow at a CAGR of 3471.2 from 2023 to 2029.

Conventional biochemistry analyzers that are used for repetitive analysis require large amount of reagents and time. However, the technologically advanced analyzers are capable of automating the process of repetitive sample analysis that were earlier done by lab technicians. Industry players are developing biochemistry analyzers with feature of positive identification that decreases the process of repeated pathogen testing. This feature is important for samples with low volume such as neonatal units. Fully automated biochemistry analyzers can perform functions such as recognition of sample and reagent bottles, cap piercing, tube sampling, dilution, and automatic re-run, which reduces human effort and time, and require lesser volumes of reagent and sample. These analyzers aid scientists in measuring the concentration of any substance in a reaction mixture. Therefore, the implementation of IT and automation in these analyzers is expected to drive the global biochemistry analyzers market growth. Furthermore, integrated systems that combine immunochemistry and biochemistry tests are gaining huge attention. It increases the workflow efficiency and deliver fast turnaround and high throughput. It also helps in achieving increased instrument capacity by connecting different analyzer units with a single sample presentation mechanism. These systems are offered by manufacturers such as Roche, Siemens, Abbott, and Beckman Coulter.
