The global Biocide for Oil and Gas market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

Biocides for oil and gas are chemical substances used to control microbial growth and prevent the formation of biofilms in oil and gas production systems. Microbes, including bacteria, fungi, and algae, can cause various problems in oil and gas production, including corrosion, fouling, and reduced production rates. Biocides are used to prevent these issues and maintain the integrity and efficiency of oil and gas production systems. Biocides can be classified into two main categories: oxidizing and non-oxidizing. Oxidizing biocides, such as chlorine and bromine compounds, are used for short-term control of microbial growth in oil and gas production systems. Non-oxidizing biocides, such as quaternary ammonium compounds, glutaraldehyde, and isothiazolinone, are used for long-term control of microbial growth in oil and gas production systems.

The global market for biocides in the oil and gas industry has experienced growth due to the increasing focus on maintaining operational efficiency, preventing microbial contamination, and ensuring environmental compliance in oil and gas exploration, production, and transportation. North America has a well-established oil and gas industry and is a significant consumer of biocides for microbial control in drilling, production, and transportation. Stricter environmental regulations and the need to mitigate corrosion-related risks drive the adoption of biocides in the oil and gas sector. Growing energy demand, increasing oil and gas exploration activities, and the need for asset protection are contributing to the demand for biocides.
