Biodegradability Analyzer is a scientific instrument used to measure the biodegradability of a substance. Biodegradability refers to the ability of a substance to be broken down by microorganisms into simpler compounds, such as water, carbon dioxide, and biomass. The analyzer works by simulating the conditions that microorganisms would encounter in a natural environment, such as temperature, pH, and nutrient availability. The substance being tested is added to the analyzer, along with microorganisms that

are known to degrade that type of substance. The analyzer then measures the rate at which the substance is broken down over time
