The global Biodegradable Batteries for Healthcare market size is predicted to grow from US\$ 108 million in 2025 to US\$ 266 million in 2032; it is expected to grow at a CAGR of 14.0% from 2026 to 2032.

Biodegradable batteries are often made from sustainable materials such as cellulose, paper and other organic compounds. These substances are easily broken down by microorganisms in the soil or water. Biodegradable batteries can be used in low-power applications, including wearable technology, sensors and medical implants. The major factors driving the development of biodegradable batteries are the growing environmental concerns and growing demand for sustainable energy sources. Due to the increasing amount of e-waste and its environmental hazards, research and development activities on biodegradable batteries are increasing around the world. The high cost recycling and limited supply of conventional battery materials have also increased the demand for the development of biodegradable batteries.

The healthcare industry is expected to provide ample growth opportunities for the biodegradable batteries market. In the healthcare industry, there is a growing demand for implantable medical devices that can be powered by biodegradable batteries. These batteries could be easily integrated into implantable medical devices, such as pacemakers and insulin pumps, without the need for additional surgery to remove them once their useful life has ended. Industry players are investing heavily in research and development of smart and unique strategies to sustain their growth in the market. These strategies include product launches, mergers and acquisitions, collaborations, partnerships, and refurbishment of existing technologies. For example, Indian company Nexus Power is using crop residues to make bio-organic fast-charging electric vehicle batteries.
