The global Biodegradable Biliary Stent market size is predicted to grow from US$ 25.4 million in 2025 to US$ 33.4 million in 2031; it is expected to grow at a CAGR of 4.7% from 2025 to 2031.

Biodegradable Biliary Stent is designed to be used to treat biliary occlusion with the added benefit of biodegradation to potentially minimize the complications associated with traditional metal stents such as perforation, stent-in-growth, stent-over-growth and the inability to remove metal stents.

Biodegradable biliary stent is a medical device used to treat biliary obstruction, which is a degradable stent unlike traditional metal or plastic stents. Biliary obstruction can be caused by a variety of causes, such as gallstones, tumors in the bile ducts, cancer of the head of the pancreas, or other biliary disorders. When biliary obstruction occurs, bile cannot flow properly into the duodenum, causing bile to accumulate in the duct, causing jaundice, abdominal pain, and other symptoms. Traditional metal or plastic braces are usually permanent and, once placed in the body, stay in place. But the biodegradable biliary stent is different. It is made of biodegradable material, which means that it will be gradually absorbed and broken down by the body over time, and eventually no longer exists. This feature helps avoid some of the complications that permanent stents can cause, such as stent thrombosis or stent-related inflammation.
