The global Biodegradable Drug Eluting Stents market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

Biodegradable Polymer Drug-eluting Stents (BP-DES) are medical devices used in the treatment of coronary artery disease. Unlike traditional stents that use permanent polymer coatings to release drugs, BP-DES incorporate biodegradable polymers that gradually degrade over time, leaving behind only the bare metal stent. These stents are designed to release drugs, typically anti-proliferative or anti-inflammatory agents, to prevent restenosis (re-narrowing of the artery) after angioplasty. The biodegradable polymer technology reduces the risk of long-term complications associated with permanent polymer stents, such as inflammation and late stent thrombosis, while still providing effective drug delivery to inhibit cell growth and maintain vessel patency.
