Biodegradable food cling film is a cling film produced from biomass, which can reduce the consumption of traditional energy sources such as petroleum. It mainly includes PLA (polylactic acid), PHA (polyhydroxyalkanoate), and PGA (polyglutamic acid). wait. Among degradable plastics in a broad sense, in addition to biodegradable plastics represented by PLA, there are also plastics that can be mechanically split, such as starch filling, oxidative degradation and other "pseudo-degradable" plastics. For example, adding a certain proportion of starch to degradable materials can cause the physical properties of the material to collapse through the biodegradation of starch, achieving the degradation effect.
