The global Biodegradable Gastrointestinal Stents market size is predicted to grow from US\$ 26250 million in 2025 to US\$ 35770 million in 2031; it is expected to grow at a CAGR of 5.3% from 2025 to 2031.

Biodegradable gastrointestinal stents are a promising alternative to permanent stents, made of biodegradable materials such as polyesters, polycarbonates, bacteria-derived polymers, and corroded metals. It may eventually be used to address the long-standing problem of in-stent restenosis. In addition, fully degradable stents are able to deliver more drug to the target site than thin drug coatings on metal stents. Biodegradable gastrointestinal stents are gradually absorbed by the gastrointestinal system, and they help maintain the patency of the gastrointestinal tract for a predetermined period of time.

Stent manufacturers are also focusing on product development due to numerous medical advancements and studies of diagnostic technology upgrades, as well as increasing demand for minimally invasive surgical treatments, utilizing smartphone applications, and more market penetration of products. Other factors expected to drive market growth include implementation of favorable government policies, significant expansion of healthcare infrastructure, extensive research and development efforts, and growing focus of diagnostic laboratories on adopting advanced technologies. According to the World Health Organization (WHO), colorectal cancer was responsible for more than 1.9 million new cases and more than 930,000 deaths worldwide in 2020. By 2040, there will be 3.2 million new cases of colorectal cancer per year (63% increase) and 1.6 million annual deaths (73% increase). Rising prevalence of cancer, rising demand for

minimally invasive surgical procedures, development of advanced diagnostic techniques, and rising disposable income are all factors contributing to the growth of the global market over the forecast period.
