Biological analyses includes determining the contaminants along with identification of biological effects. These assays also assist in identification of the compounds imposing positive health effects such as inhibition and activation of cellular pathways.

Contaminant detection is based on detection of biological effect or chemical analysis, and the services include the detection of contaminants in defense, food and environment settings, and clinical. Chemical analyses aid in detection and determination of complex mixture of bioactive compounds present in the sample. These analyses involve the implementation of several chemical analytical fractionation techniques such as solid phase extraction (SPE), high performance liquid chromatography (HPLC), and gel permeation chromatography.
