Bioimpedance sensor is a sensor that monitors physiological status by measuring the changes in electrical impedance in the body. Its principle is based on the different impedances of different tissues (such as blood, muscle, fat, etc.) to electric current. The sensor obtains biological information in the body by applying a weak current and measuring the electrical impedance. This technology can be used to monitor physiological indicators such as heart rate, respiratory rate and galvanic skin response in real time with high accuracy. It is widely used in health monitoring, sports medicine and disease warning.
