The global Bioenergy Power Generation market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

Bioenergy Power Generation is the process of converting biomass, such as agricultural residues, forestry byproducts, and organic waste, into electricity or heat energy. This environmentally friendly method harnesses the energy stored in biological materials through processes like combustion, gasification, or anaerobic digestion, contributing to sustainable energy production and reducing greenhouse gas emissions.

According to BNEF data, electrochemical energy storage in the United States added 3.97GW / 10.88 GWh in 2021. In terms of power, it accounted for 40% of the global increase. In 2022, the United States passed the IRA, which subsidized independent energy storage for the first time. Under the ITC, new energy storage projects could offset up to 30% of the investment. The effect of the policy has initially appeared, and the energy storage industry in the United States shows an upward trend.
