The global Biofilm Inhibitors market size is predicted to grow from US$ 365 million in 2025 to US$ 473 million in 2032; it is expected to grow at a CAGR of 3.8% from 2026 to 2032.

Biofilm inhibitors are a class of active substances that can inhibit, destroy or prevent the formation and development of microbial biofilms. Biofilms are protective polymer matrix structures formed by microorganisms (such as bacteria and fungi) on surfaces (such as medical devices, tissue wounds, and the inner wall of water pipes). They can significantly increase the resistance of microorganisms to antibiotics and disinfectants, leading to problems such as chronic infection and equipment contamination. Biofilm inhibitors can work through a variety of mechanisms, such as inhibiting cell adhesion, interfering with quorum sensing, destroying the extracellular polysaccharide matrix, enhancing antibiotic penetration or activating host immune responses. Their types include small molecule compounds, enzymes, biosurfactants, antibodies, metal nanomaterials, etc. This type of agent is widely used in the fields of medicine, industrial water treatment, food processing, dentistry, agriculture, and environmental engineering, and is an important strategy to solve drug-resistant infections and improve system cleaning efficiency.

United States market for Biofilm Inhibitors is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.

China market for Biofilm Inhibitors is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.
