Biofilms are complex matrixes composed of many different molecules such as polysaccharides, proteins, lipids, and nucleic acids (DNA and RNA). DNA in form of external DNA (eDNA) has an important role in the early formation of the biofilm as a major component for initial bacterial attachment to surfaces and the subsequent early phase of biofilm development. Biofilm removal products are able to degrade DNA in polymer matrices produced by microbial communities and disperse pre/post biofilms, effectively eliminating stubborn biofilms in environments such as food, industrial or medical.
