Sugar is currently the most efficient raw materials for producing biofuels in the market. Ethanol, its derivative, reduces greenhouse gas emissions by up to 90% compared with conventional fuels. Additionally, it can also be used as a raw material for next-generation biofuels, such as sugarcane diesel and biobutanol. Sugar crops, such as sugar cane, sugar beet and sweet sorghum, can be used as feedstocks for both conventional biofuels (ethanol via fermentation of sugar) and/or advanced biofuels. Residual beet pulp and bagasse (the fibrous material left after sugar extraction from cane or sorghum) can be used to produce cellulosic ethanol. Fermentable sugars can also be converted to 'drop-in' biofuels via biotechnology (e.g. Amyris/Total) or chemical catalysis (e.g. Virent).

According to this study, over the next five years the Biofuel from Sugar Crops market will register a xx% CAGR in terms of revenue, the global market size will reach US\$ xx million by 2024, from US\$ xx million in 2019.
