The global Biofuels for Aviation market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

Biofuel for Aviation is a type of fuel derived from renewable sources, such as algae, agricultural crops, or waste biomass. It is designed to reduce the carbon footprint of aviation by offering a more sustainable alternative to traditional fossil-based jet fuel.

Biofuels used in aviation are typically blended with conventional jet fuel in various ratios. The commonly used biofuel in aviation is called hydroprocessed esters and fatty acids (HEFA), which is produced through the hydroprocessing of plant oils or animal fats. HEFA biofuels have similar properties to traditional jet fuels and can be used as a "drop-in" replacement without requiring modifications to aircraft engines or infrastructure. Aviation biofuels are derived from renewable feedstocks, which can be grown and harvested without depleting finite fossil fuel resources.

The aviation industry is actively working towards the increased adoption of aviation biofuels through research, development, and commercial-scale production. Various airlines and airports have conducted successful trial flights using biofuels, demonstrating their technical feasibility and environmental benefits. The widespread use of aviation biofuels depends on factors such as feedstock availability, cost competitiveness, supportive government policies, and market demand. Continued research, development, and investment in sustainable aviation fuels are essential to accelerate their deployment and help reduce the environmental impact of aviation.
